

A Commitment you can verify.

IIRY binds an image to a fresh identity presentation from an EUDI Wallet*, creating a verifiable identity-to-image bond.

Commitment

an image with its own proof trail

Image
the content under review

Wallet presentation
fresh holder proof for disclosed attributes

Receiver checks visually and cryptographically.

* Implementation built and tested against the German EUDI Wallet Sandbox.

Ask for a Commitment.

E.g. for high-stakes requests in chat, ask for a verifiable Commitment. The other party commits to a screenshot where the request, challenge, date, and code are visible.

Challenge
Is it really you? + date + short code

Screenshot image
the request stays visible

Commit
binds identity evidence to the image

Experimental Prototype

Bind identity to image.

A fresh Wallet presentation is requested for the image being committed to. IIRY carries that holder evidence inside the Commitment.

Wallet presentation

selected identity attributes before sharing

The following data are requested:

2 from 13 of German PID

Family name

Given name(s)

Show details

Inside the Commitment

the image and holder evidence travel together

Image bytes

the original image data

Disclosed attributes

selected identity data

Fresh holder binding

proof bound to this request

Embedded commitment

the bond travels in the file

Verify the identity-to-image bond.

IIRY checks the image bytes, embedded identity evidence, and Wallet holder presentation against the same binding.

✓ **Valid EUDI Wallet holder presentation bound to this JPEG.**

✓ **Same image**
the committed image still matches

✓ **Same identity evidence**
the disclosed wallet attributes validate

✓ **Same binding**
the holder proof matches the image request

Experimental Prototype

Open standards, open source.

IIRY is a hackathon prototype that composes Content Credentials, CAWG identity assertions, and OpenID4VP holder-bound wallet evidence.

C2PA / Content Credentials
binds provenance metadata to the image bytes

CAWG identity assertion
carries identity evidence inside the C2PA manifest

IIRY CAWG prototype extension
defines the holder-binding profile used by this prototype

OpenID4VP / SD-JWT VC
uses holder-bound wallet presentation semantics from the German EUDI flow

CAWG VC+VP support is draft work; IIRY implements an OpenID4VP / SD-JWT VC profile for the German EUDI Wallet hackathon flow.

Open source implementation
